

Description of New Rodents and Discussion of the Origin of Dæmonelix (Classic Reprint) By Olof August Peterson

Excerpt from Description of New Rodents and Discussion of the Origin of Dæmonelix The superior incisors are comparatively as large and strong as those of the recent beaver; anteriorly the broad and flat surface is covered with a heavy coating of enamel which forms rather sharp angular edges laterally, The chisel-shaped gnawing portions of the teeth are long and terminate anteriorly in a broad sharp edge, The superior grinding teeth are rather small in comparison with the size of the skull, Their position is nearly parallel with the long axis of the skull and they are placed about midway between the anterior and posterior extremities of the skull. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books, com This book is a reproduction of an important historical work, Forgotten Books uses state-of-the-art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy, In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition: We do however repair the vast majority of imperfections successfully; any imperfections that remain are intentionally left to preserve the state of such historical works.

Description of New Rodents and Discussion of the Origin of Dæmonelix (Classic Reprint)

. The rounded lateral and posterior faces have no enamel. The antero-posterior diameter is as great as the transverse. They gradually decrease in size from pi to mi. Find more at www.forgottenbooks
